The Action Plan

6 Action Plans - for implementing N(S)WRM into the RBMPs

The action plan summarizes the work carried out in the pilot area during the project development, the results obtained and formulates a proposal for the range of possible developments in the area that are considerable in terms of drought, flood and water quality and contribute to the objectives of the Water Framework Directive.

The Action Plan was developed on the basis of the Concept Plan for 6 Pilot Catchments of the project. The Concept Plan was based on the landscape valorization map (developed in FroGIS) and by building upon the first results of the static and dynamic modelling of the pilot catchment. The Concept Plan gives information on the best locations and suitable types of measures with the cumulative effect. Action plan is an implementation document which describes clear steps, timeline, financial resources and responsible actors for integrating N(S)WRMs into River Basin Management Plans (RBMPs).
